## 3. ARITHMETIC ON $\mathbb{N}$

ASILATA BAPAT

### ADDITION

How can we make sense of “ $1 + 2 = 3$ ” if  $1 = \{ \emptyset \}$  and  $2 = \{ \emptyset, \{ \emptyset \} \}$ ? The strategy is to define a function of “addition of  $m$ ” for every  $m \in \mathbb{N}$ .

**Theorem.** *For every  $m \in \mathbb{N}$ , there exists a function  $S_m \subseteq \mathbb{N} \times \mathbb{N}$  such that*

- (1)  $S_m(0) = m$
- (2)  $\forall n \in \mathbb{N}, S_m(n^+) = (S_m(n))^+$

*Proof.* First we show that there exists at least one relation  $S'_m \subseteq \mathbb{N} \times \mathbb{N}$  with the “right” properties. Then we show that  $S'_m$  is a function. Define

$$S_m := \{ R \subseteq \mathbb{N} \times \mathbb{N} \mid (0, m) \in R \text{ and if } (n, x) \in R \text{ then } (n^+, m^+) \in R \}$$

$S_m \neq \emptyset$  because  $\mathbb{N} \times \mathbb{N} \in S_m$ . Set

$$S'_m := \bigcap_{R \in S_m} R$$

$S'_m$  is the smallest relation with the properties. We will **show that  $S'_m$  is indeed a function**. It has the required properties by construction.

- (1) We need to show  $\text{Domain}(S'_m) = \mathbb{N}$ .

Let  $p(n)$  be true if  $\exists x$  s. t.  $(n, x) \in S'_m$ . It is obvious that  $p(0)$  is true because  $(0, m) \in S'_m$ . Suppose  $p(n)$  is true if  $\exists x \in \mathbb{N}$  s. t.  $(n, x) \in S'_m$ . So  $\forall R \in S_m, (n, x) \in R \implies (n^+, x^+) \in R \implies (n^+, x^+) \in S'_m \implies p(n^+)$  is true. So by induction,  $\text{Domain}(S'_m) = \mathbb{N}$ .

- (2) We need to show that if  $(n, x), (n, y)$  are both in  $S'_m$ , then  $x = y$ .

Let  $p(n)$  be true:  $\forall r \in n$ , there exists a unique  $x \in \mathbb{N}$  s. t.  $(r, x) \in S'_m$ . Note that  $p(0)$  is vacuously true.

Suppose  $p(n)$  is true, we want to show  $p(n^+)$  is also true. Let  $r \in n^+ = n \cup \{n\}$ . This means that  $r = n$  or  $r \in n$ . If  $r \in n$ , we already know the statement is true; If  $r = n$ , suppose that  $(n, a) \in S'_m$  and  $(n, b) \in S'_m$ .

**Claim.** *At most one of  $(n, a)$  and  $(n, b)$  can have a “predecessor” in  $S'_m$ .*

Suppose  $(p_1, x_1) \in S'_m$  and  $(p_2, x_2) \in S'_m$  s. t.  $(p_1^+, x_1^+) = (n, a)$  and  $(p_2^+, x_2^+) = (n, b)$ . Since  $p_1^+ = p_2^+ = n$ , we have  $p_1 = p_2$  and  $p_1 \in n \implies (p_1, x_1) \in S'_m$  and  $(p_2, x_2) \in S'_m$  imply  $x_1 = x_2$ . So,  $a = x_1^+$  and  $b = x_2^+ \implies a = b$ . If  $a \neq b$ , either  $\nexists (p_1^+, x_1^+) = (n, a)$  or  $\nexists (p_2^+, x_2^+) = (n, b)$ .

Suppose (WLOG)  $\nexists p_1$  s.t.  $(p_1^+, x_1^+) = (n, a)$  and  $(p_1, x_1) \in S'_m$ , then we can remove  $(n, a)$  from  $S'_m$  by defining  $S''_m := S'_m - (n, a)$  and we get a smaller relation with the same properties! This cannot happen because  $S'_m$  is the intersection of all  $R$ , which implies  $S'_m \subset S''_m$

So, by (1) and (2),  $\exists! a$  s.t.  $(n, a) \in S'_m$ , and so  $p(n^+)$  also is true  $\implies S'_m$  is a function with the desired properties  $S_m$ .  $\square$

We can now prove the following facts:

- (1)  $\forall n \in \mathbb{N}, S_1(n) = n^+$ .
- (2)  $\forall n \in \mathbb{N}, S_0(n) = n$ .
- (3)  $\forall m, n, k \in \mathbb{N}$ , we have  $S_{S_m(n)}(k) = S_m(S_n(k))$  (associativity)
- (4)  $\forall m, n \in \mathbb{N}$ , we have  $S_m(n) = S_n(m)$  (commutativity)

All properties are proved by induction.

Proof of (1) Let  $p(n)$  be true if  $S_1(n) = n^+$ .  $S_1(0) = 1 = 0^+$ . So  $p(0)$  is true. Suppose  $p(n)$  is true. Then

$$S_1(n^+) = [S_1(n)]^+ = (n^+)^+$$

So  $p(n^+)$  is true  $\rightarrow$  induction.

Proof of (2) Let  $p(n)$  be true if  $S_0(n) = n$ .  $p(0)$  is true because  $S_0(0) = 0$ . Let  $p(n)$  be true. Then

$$S_0(n^+) = [S_0(n)]^+ = n^+$$

So  $p(n^+)$  also is true  $\rightarrow$  induction.

Proof of (3) Let  $p(k)$  be true if  $\forall m, n$  we have  $S_{S_m(n)}(k) = S_m(S_n(k))$ . For  $k = 0$ ,  $S_{S_m(0)} = S_m(n)$ ;  $S_m(S_n(0))S_m(n) = S_{S_m(0)}$ . So  $p(0)$  is true. Suppose  $p(k)$  is true. Then

$$S_{S_m(n)}(k^+) = [S_{S_m(n)}(k)]^+ = [S_m(S_n(k))]^+ = S_m[(S_n(k))^+] = S_m(S_n(k^+))$$

So  $p(k^+)$  is true  $\rightarrow$  induction.

Proof of (4) Let  $p(n)$  be true  $\forall m \in n$ , we have  $S_m(n) = S_n(m)$ . For  $n = 0$ ,  $S_m(0) = m = S_0(m)$ . So  $p(0)$  is true. Suppose  $p(n)$  is true.

$$S_m(n^+) = [S_m(n)]^+ = [S_n(m)]^+ = S_n(m^+) = S_n(S_1(m)) = S_{S_n(1)}(m) = S_{S_1(n)}(m) = S_{n^+}(m)$$

So  $p(n^+)$  is true  $\rightarrow$  induction.

There are some more properties of  $\mathbb{N}$ .

- (1) If  $m, n \in \mathbb{N}$ ,  $m \in n$  iff  $m \subsetneq n$ .
- (2) If  $m, n \in \mathbb{N}$ , we say that  $m < n$  if  $m \in n$ , and  $m \leq n$  if  $m \in n$  or  $m = n$ . Then  $\forall M, N \in \mathbb{N}$ , exactly one of the following is true (Trichotomy):

$$m < n \text{ or } n < m \text{ or } m = n$$

- (3) For every  $m, n \in \mathbb{N}$ , we have  $m \leq n$  iff there is a unique  $k \in \mathbb{N}$  such that  $m + k = n$
- (4) For every  $m, n, k \in \mathbb{N}$ , if  $n + m = n + k$  then  $m = k$  (Cancellation).

### SUBTRACTION AND MULTIPLICATION

**Definition** (Subtraction). Given  $m, n \in \mathbb{N}$ , such that  $m \leq n$ , define  $n - m$  to be the unique  $k \in \mathbb{N}$  such that  $m + k = n$

*Remark.* This satisfies the usual properties.

Multiplication is defined similarly to addition. Fix  $m \in \mathbb{N}$ , then  $\exists$  a function  $P_m : \mathbb{N} \mapsto \mathbb{N}$  with the following properties:

- (1)  $P_m(0) = 0$
- (2)  $P_m(n^+) = P_m(n) + m$

(Proved analogously to  $S_m$ )

We eventually write  $P_m(n)$  as  $m \cdot n$  or  $mn$ .

Multiplication satisfies the following properties:  $\forall m, n, k \in \mathbb{N}$

- (1)  $P_m(0) = 0$
- (2)  $P_1(n) = n$
- (3)  $P_m(n) = P_n(m)$  (commutativity)
- (4)  $P_m(P_n(k)) = P_{P_m(n)}(k)$  (associativity)
- (5)  $P_m(n + k) = P_m(n) + P_m(k)$  (distributivity)
